

### AIRPORT CHALLENGE

To face **resource allocation issues** (space, personnel) and **new cyber-risks and regulatory constraints**.

### SOLUTION

- IN Groupe solution merge **identity, biometric** and **boarding data** in a single **digital credential** (a QR code)
- The credential can be read across airport infrastructure and is not tied to proprietary systems, ensuring **interoperability** between airports
- Biometric data remain stored on the passenger device and not on a central database, it facilitates **regulatory approval** in countries with strict privacy laws
- Passengers enroll for the service on a mobile app or on a self-service kiosk. Passengers QR-codes are verified at check points **with facial verification** capability

### RESULT

**Marseille has started operations** using the Fast Track biometric service in May 2025. The solution has been **approved** for deployment. By enabling **faster and secure passenger authentication**, the airport **reduces friction** at bag drop and boarding, with **optimized personnel** requirements
